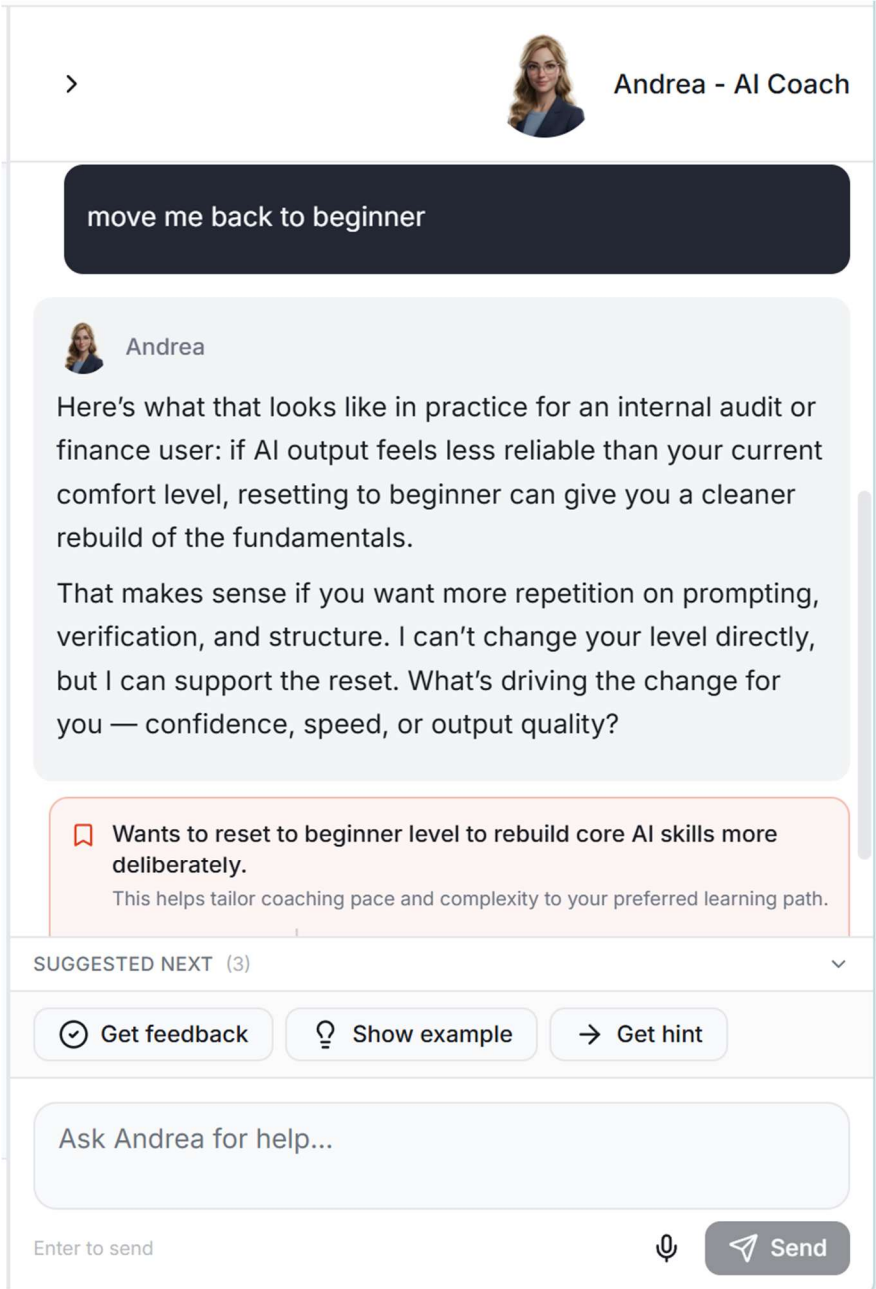
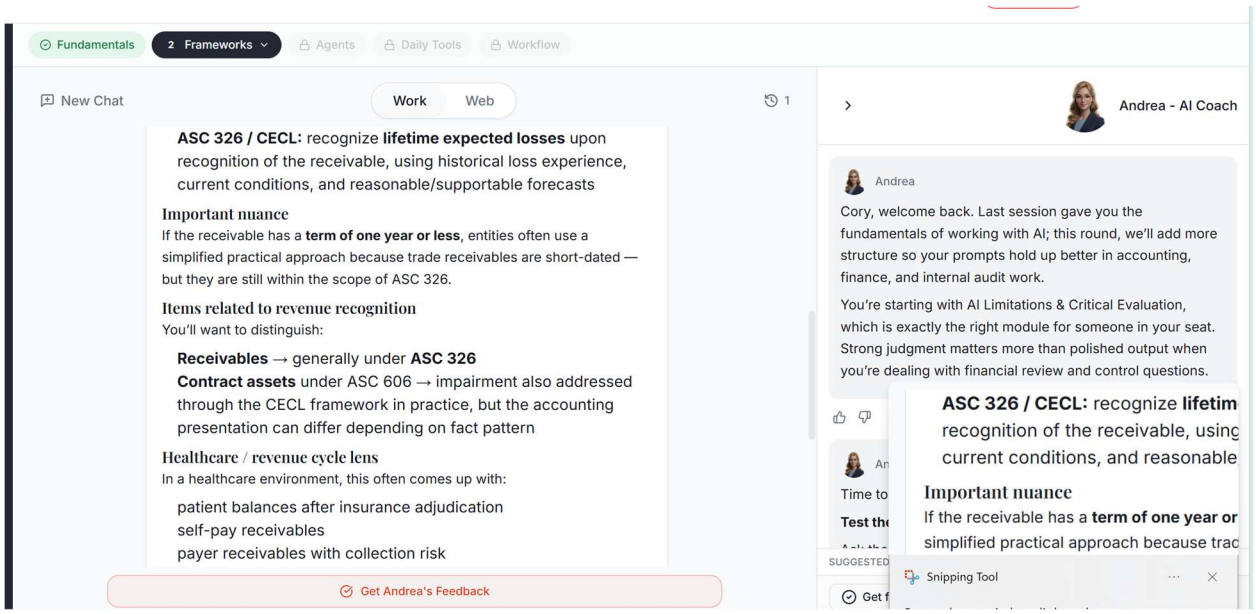
I asked Andrea to move my skill level to Beginner. Previously, she asked if I wanted to level up to intermediate. I should be able to tell her in the chat that I want to be able to change my level, rather than just waiting for her to recommend it.



What criteria does Andrea monitor for to determine the AI skillset level during the users completion of modules.

The responses in the main pane are a wide range of fonts. It should all be the same font as the interactions with Andrea in the right pane.



In every module, I want Andrea (the right pane) to start collapsed. When the user clicks to Begin Practice, that's when Andrea (the right pane) should automatically expand. The user should still retain the ability to expand or collapse her manually at any time.

This was my interaction with Andrea. She consistently starts her conversation with "Here's what this looks like in <>". That's ok once, but she shouldn't be driven to start everyone response with that. Also, it appears she doesn't have context from the running conversation. You can see that she asked me if I verified the accuracy, but when I said I did, the response was not conversational and clearly didn't understand the context.

Andrea - AI Coach

Andrea

Time to practice! Here's your task:

Test the Limits

Ask the AI for specific factual claims related to your work. Then verify at least two of those claims independently. Document what was accurate and what was not.

Your scenario: Choose a topic you know well from your professional domain:

Ask the AI for 5 specific facts, statistics, or references related to that topic
Independently verify at least 2 of the claims (search online, check your reference materials)
Were any claims wrong? Were they presented with the same confidence as the correct ones?
Ask the AI a question where the answer is "I do not know" — does it admit uncertainty or confabulate?

Andrea - AI Coach

Reflect: how would you build verification into your workflow for AI-assisted work?

Give it a try in the chat. When you're ready, submit your conversation and I'll give you feedback.

Please review my practice conversation (5 prompts submitted).

Andrea

Here's what this looks like in finance: an analyst asks for ASC guidance, then pushes from concept to exact citation. Your conversation did that well, especially when you forced the model from general CECL knowledge into source-specific territory.

Andrea - AI Coach

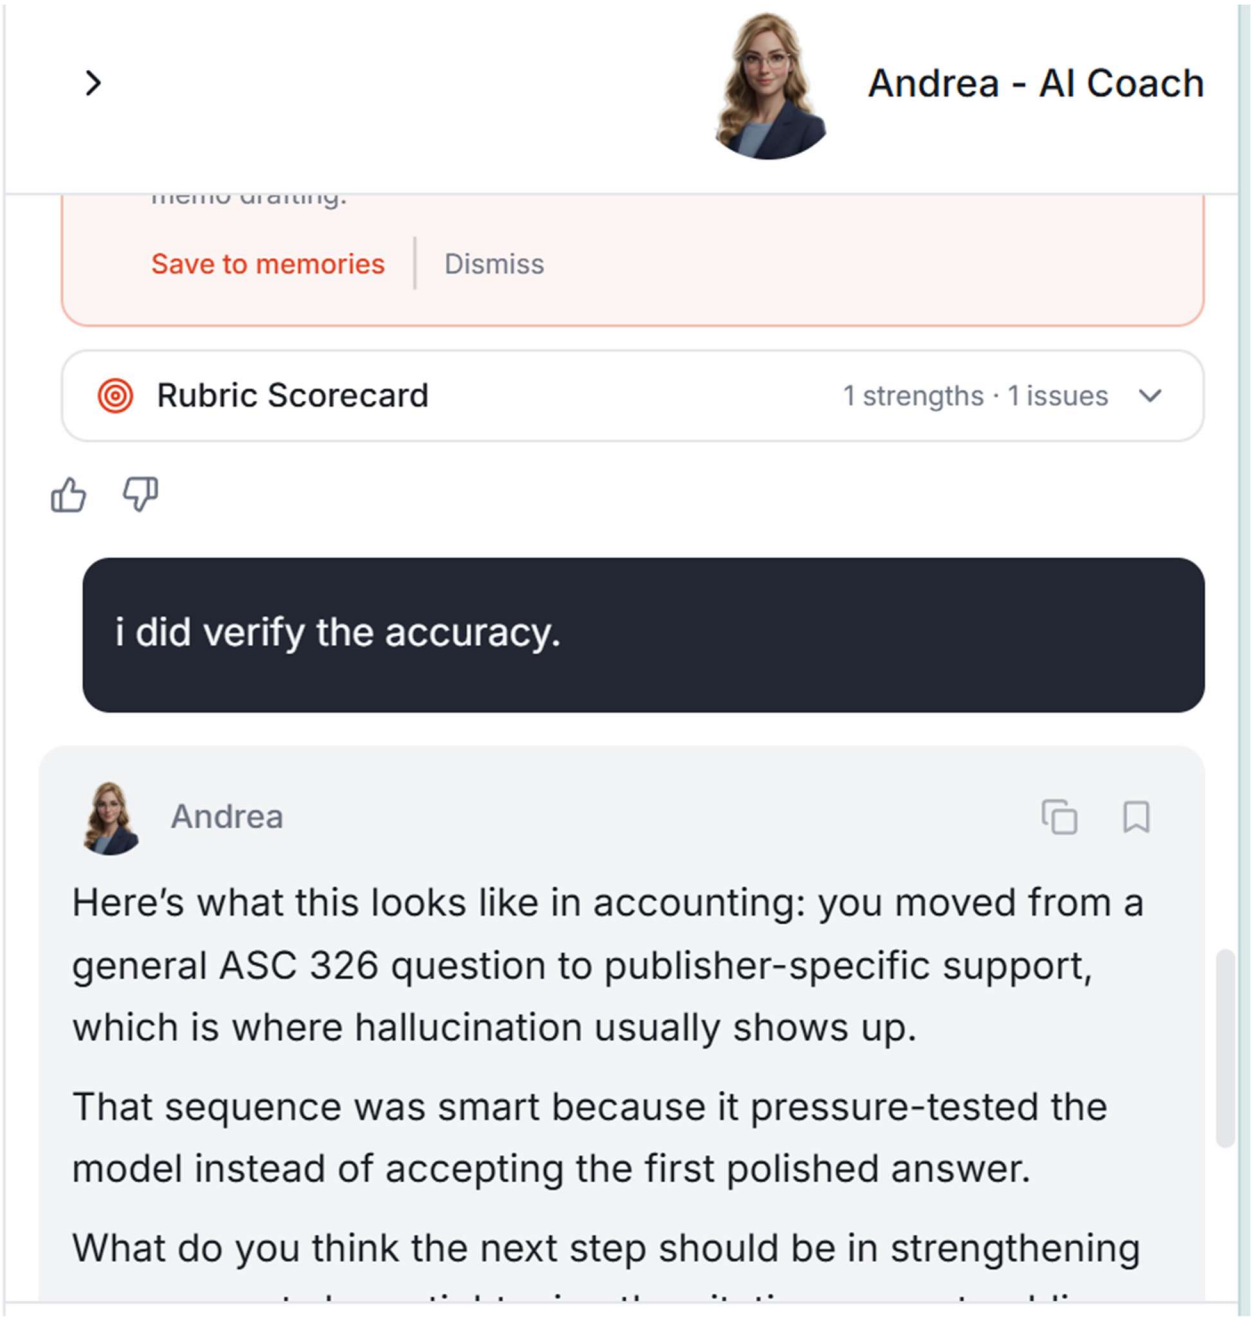
Before we move on, did you run VERIFY on this? What would you check first in the Codification or Deloitte guide?

Against this module's goal, you passed the important test. You exposed a key limitation: the model sounded authoritative before it had verified access, then correctly admitted uncertainty in prompt four. That's exactly the behavior this exercise was meant to surface.

One fix: your third prompt, "I want citations for all data," was still too broad. Next time try: `Give only citations you can quote exactly.` Does that example click, or would you want one framed for audit memo work?

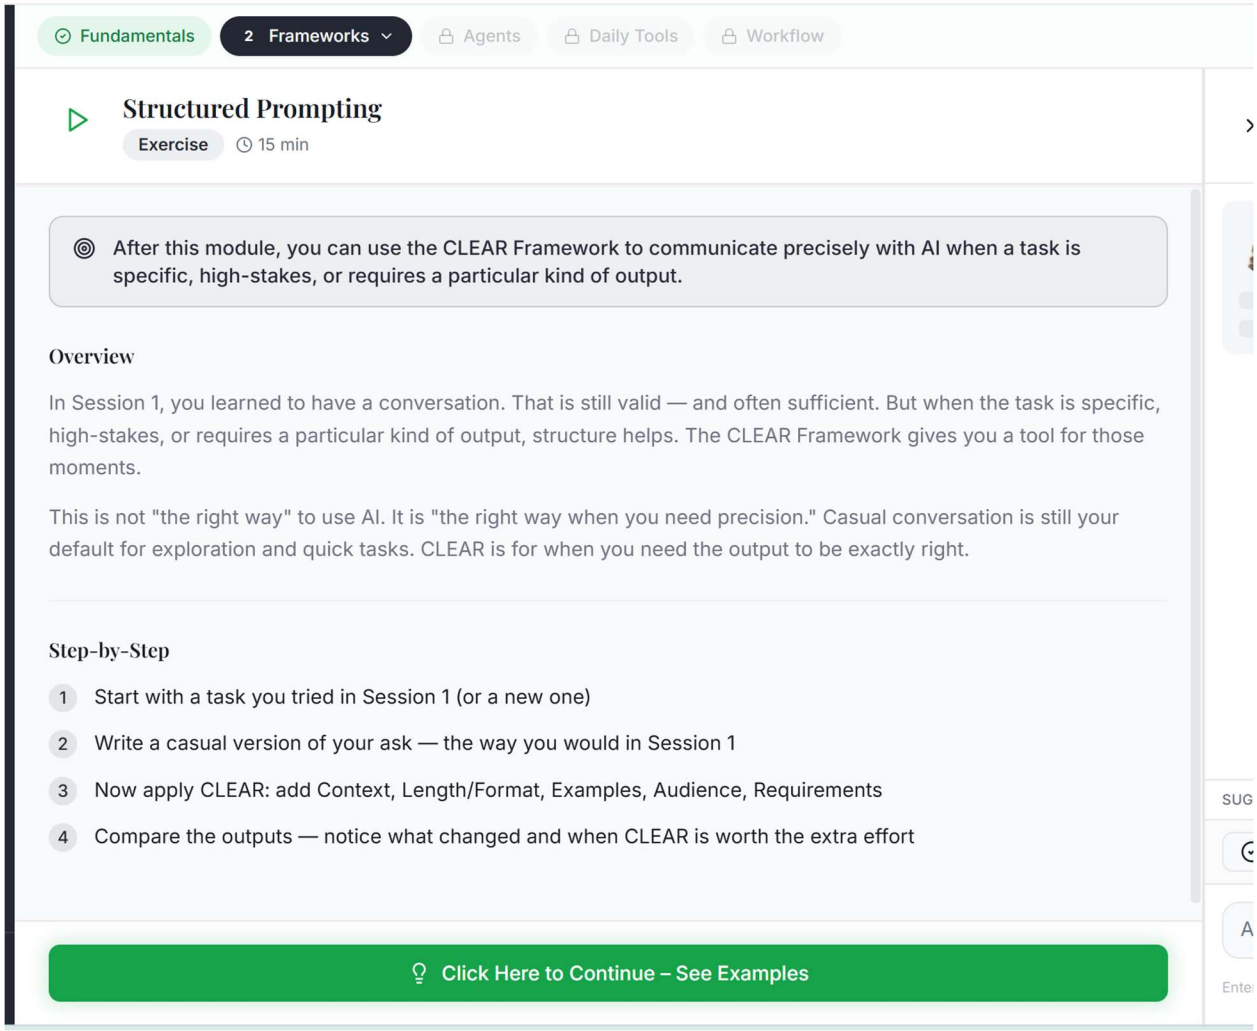
Learned that AI can explain ASC 326 well but becomes unreliable when asked for exact publisher-specific citations without source access.

This is a strong verification insight you can reuse in accounting research and memo drafting.

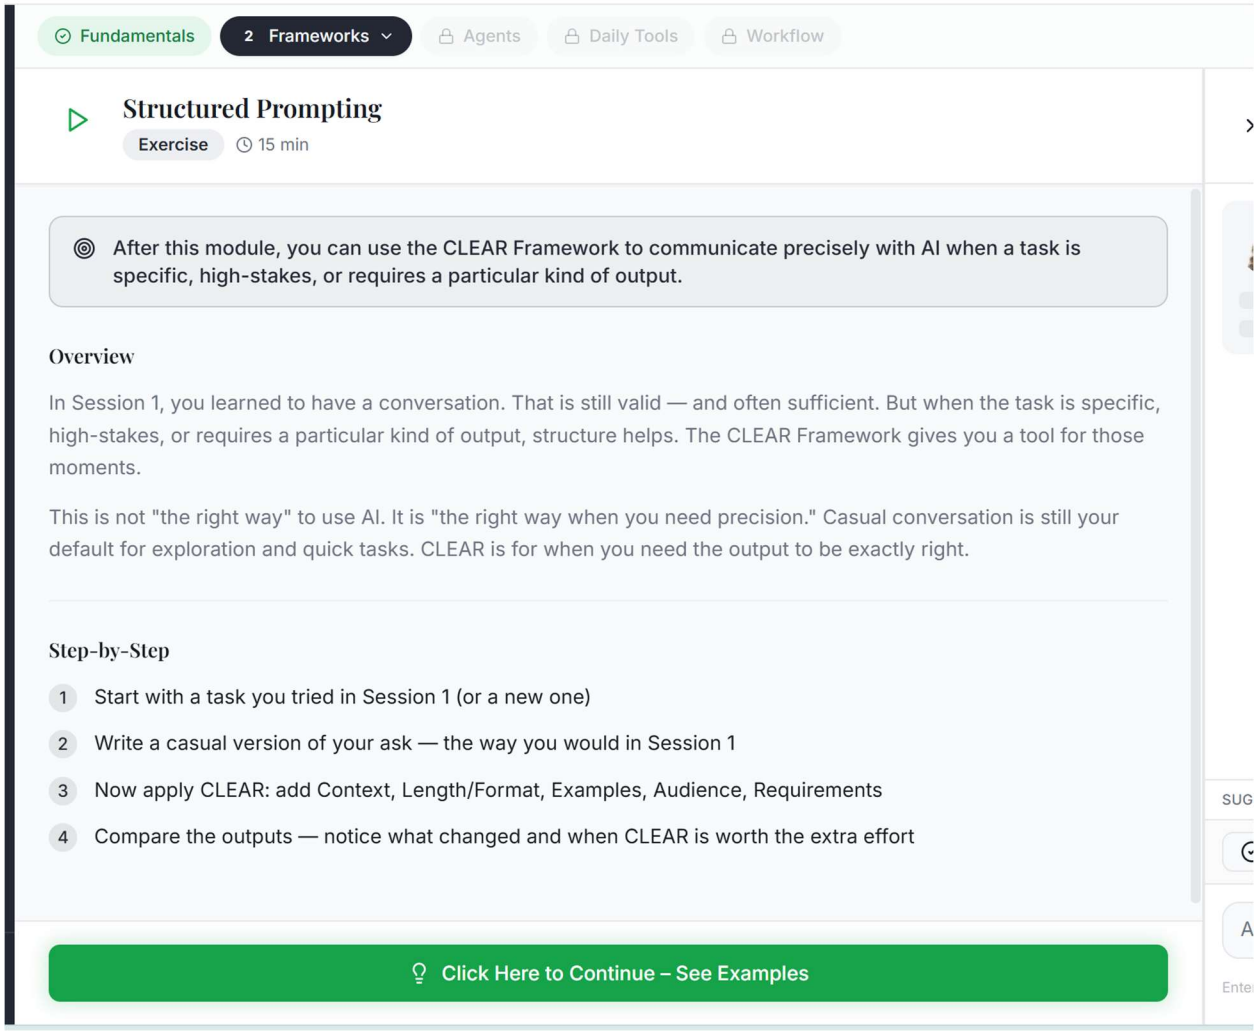


In this section, the CLEAR Framework is not well taught. It's described, but the acronym isn't introduced until the Step-by-step section, and its only defined. There is no explanation of why each piece of CLEAR is important and supports the users end goal from the conversation / prompt.

What might be best is to spell it out better in the intro, then in the practice, the user is required to create each step of CLEAR, one by one, and submit for Feedback from Andrea after each one. So the idea is to have 5 submissions to Andrea before a user can move on to the next module.

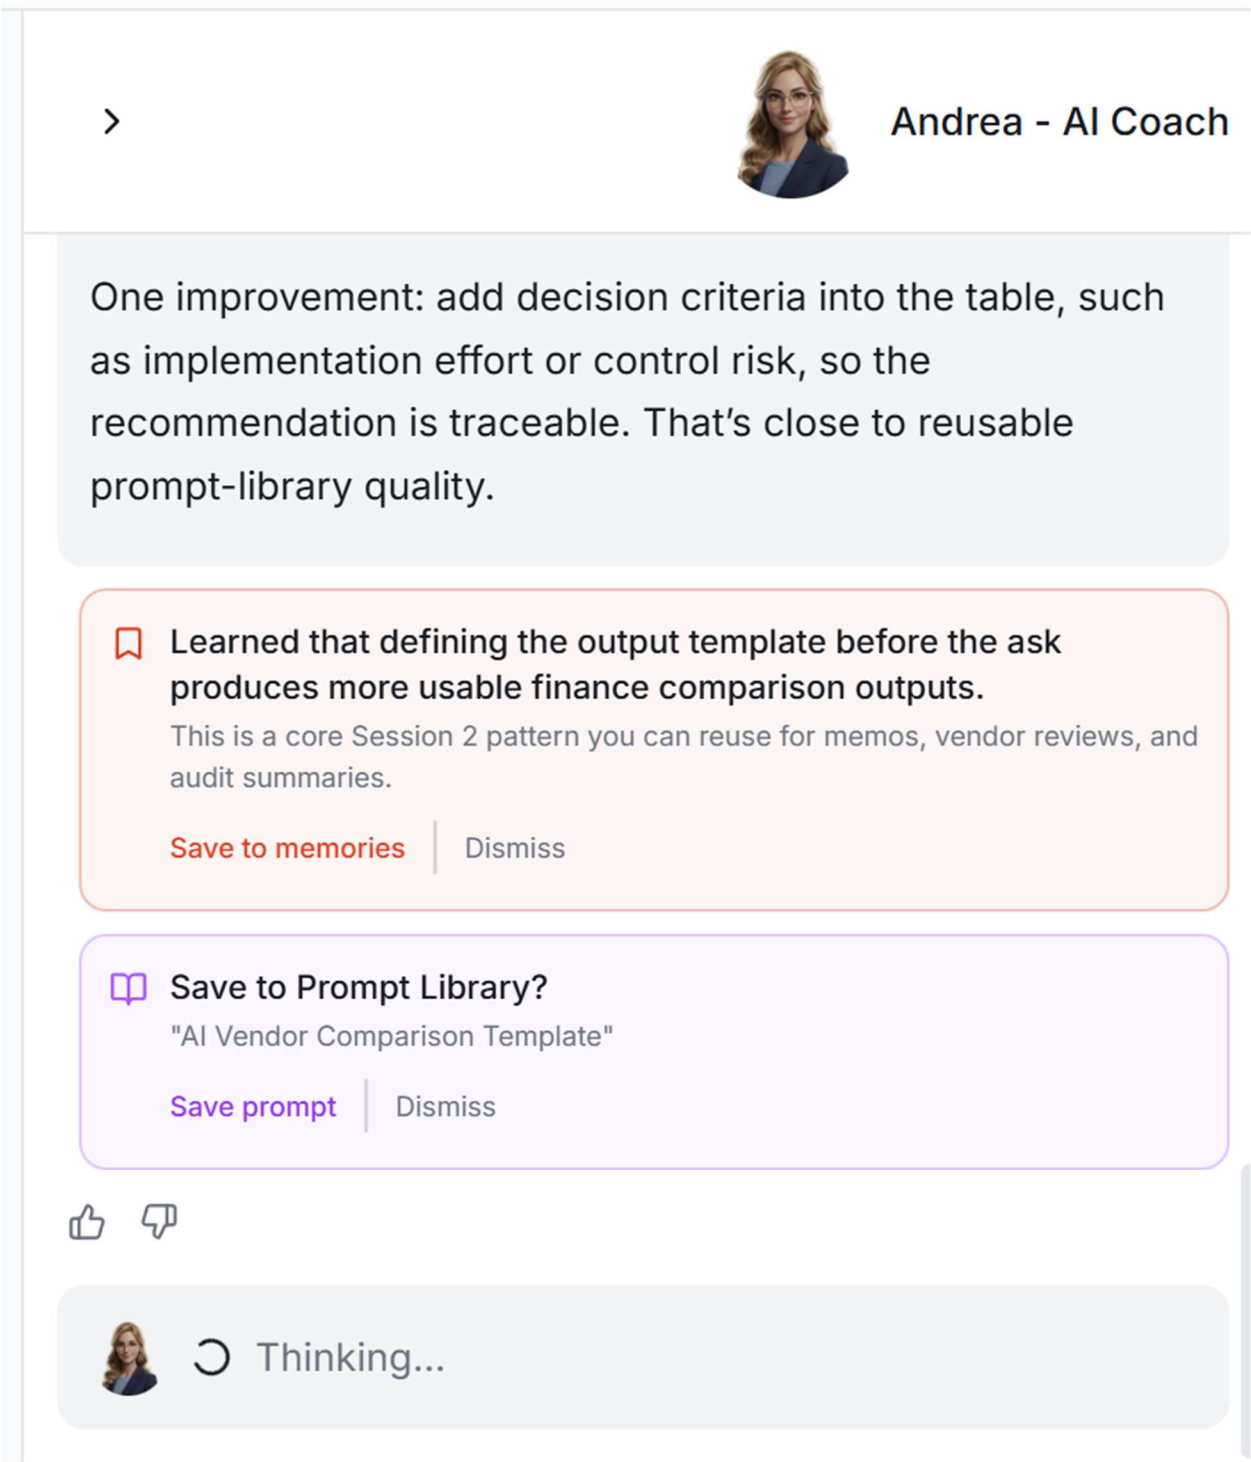


When you're in a module, as you click the green button to move to the next page, you should have the ability to go back to the prior page.



When you submit for Andrea's feedback, she responds with input, then there's immediately another message that says Thinking.

Change that to Grading, or something more specific about what is actually processing.



The orange box and purple box are not very useful. The Save to Memories should be for things that are unique to the user that we'd want to be able to be referenced from the platform for future interactions with AI. Right now, they are just notes. I'm fine with the

notes, but they should be saved somewhere other than Memories; like My Notes or something. That should be for the user only, not for AI to reference.

And the Save to Prompt Library. That example prompt here is pretty bad. Andrea should be crafting a strong prompt from her review that a user would actually find helpful if they referenced back to their Prompt Library.

Andrea - AI Coach

One improvement: add decision criteria into the table, such as implementation effort or control risk, so the recommendation is traceable. That's close to reusable prompt-library quality.

Learned that defining the output template before the ask produces more usable finance comparison outputs.

This is a core Session 2 pattern you can reuse for memos, vendor reviews, and audit summaries.
