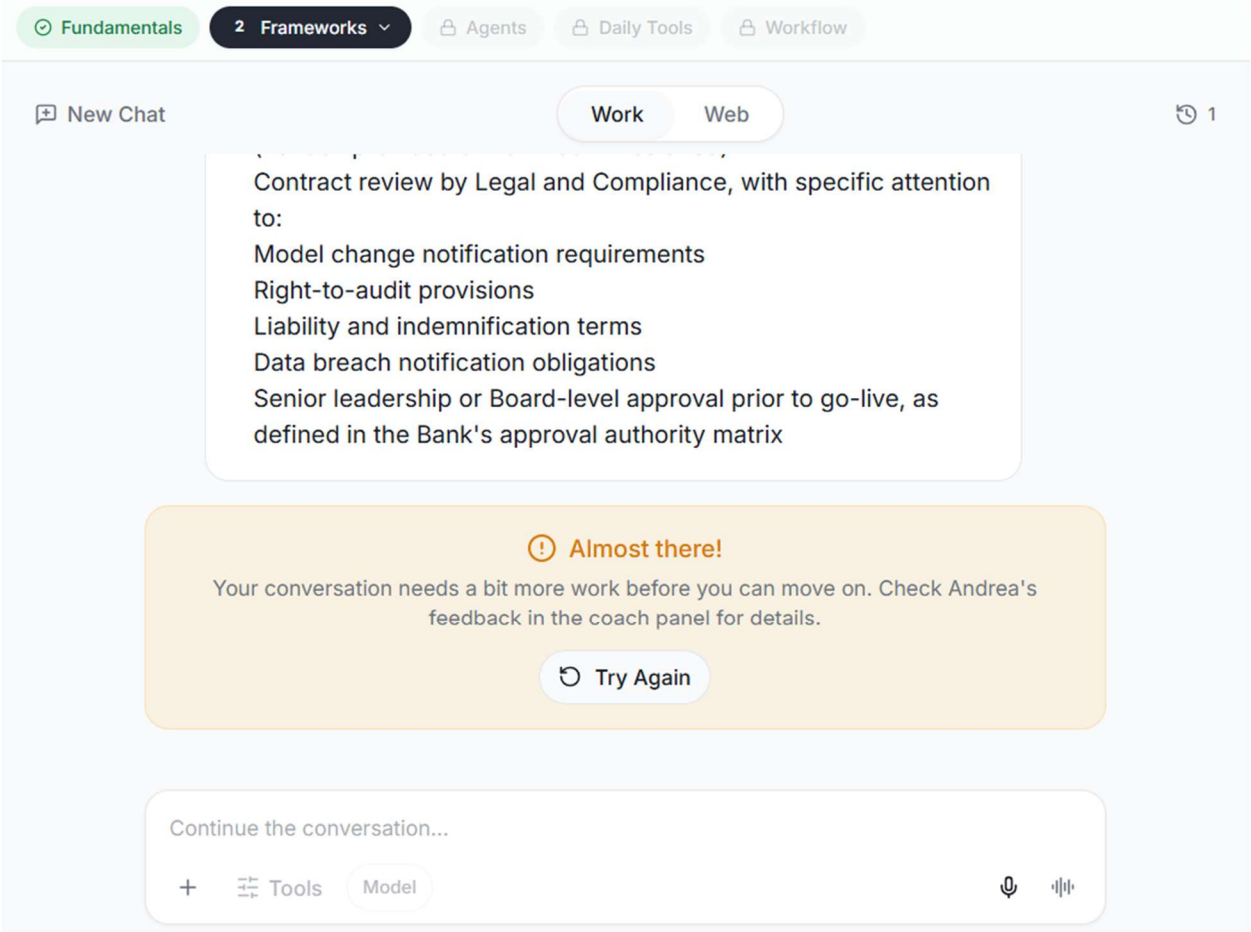
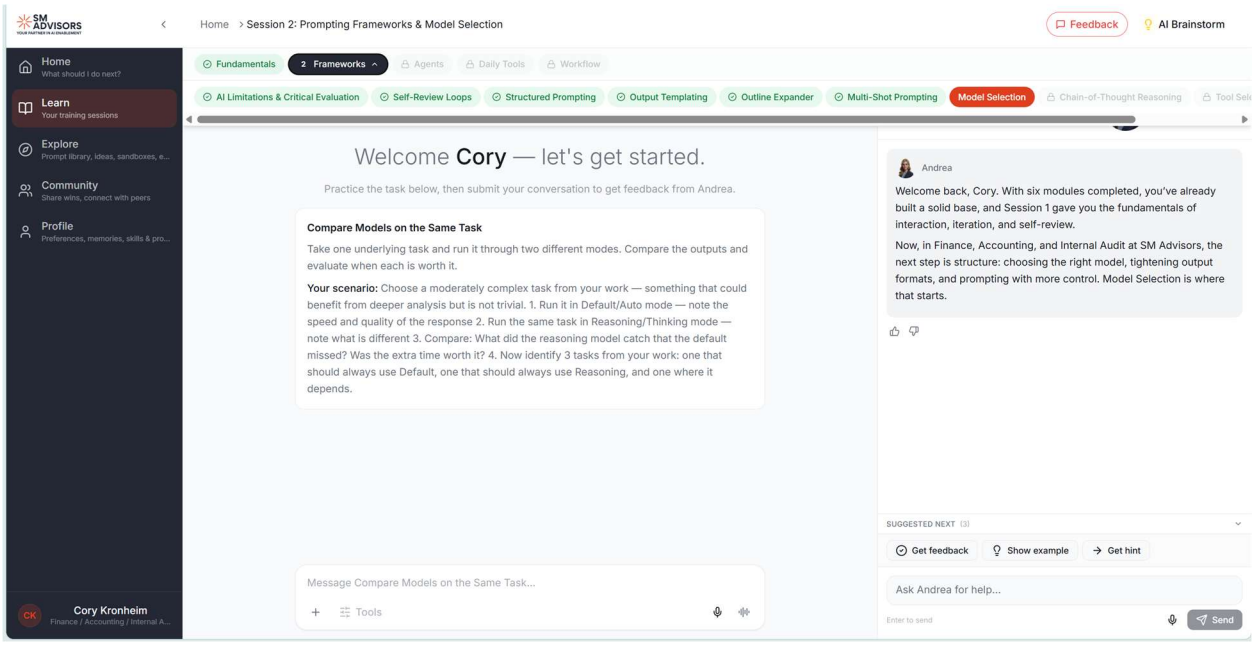
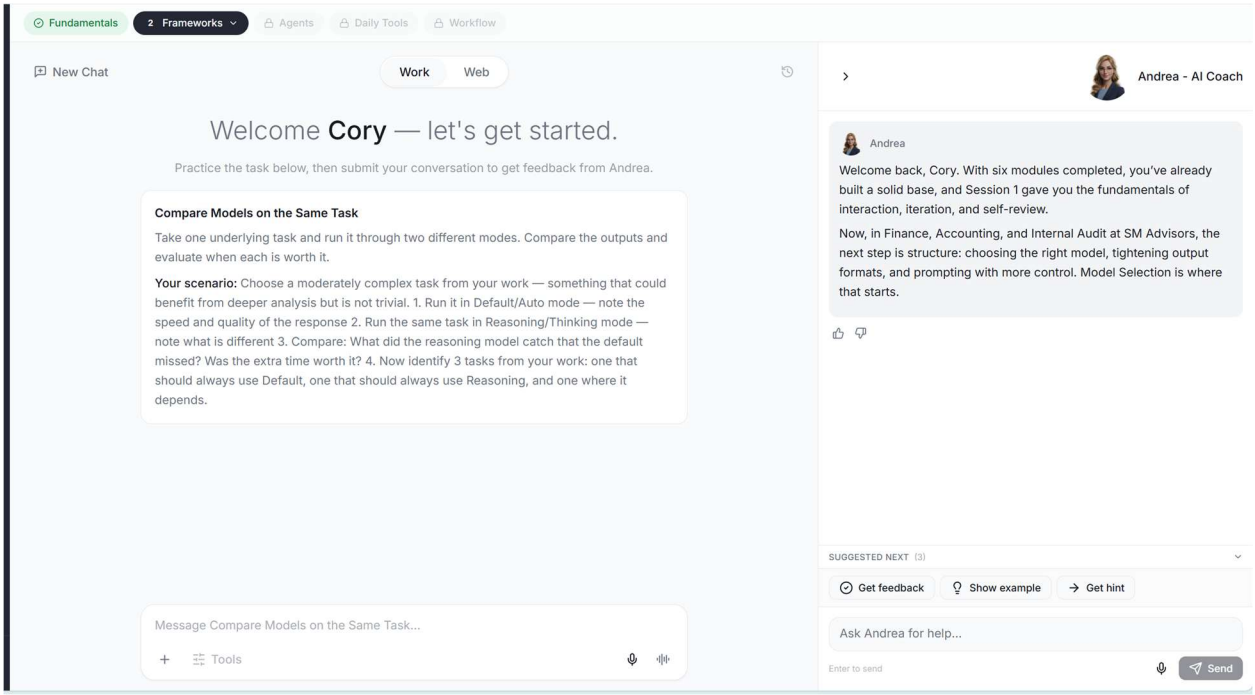
When a user doesn’t sufficiently complete a module, a Try Again card appears. When the user clicks to try again, they should have the option to continue in existing conversation or start a new conversation.



In the model selection module, the user still doesn’t have the ability to change between models. There should be





In the AI Brainstorm with Andrea, when Andrea gets to suggestions for how to use AI or build automated workflows, she is extremely wordy, and the presentation of her response is pretty awful from the UX side. I think the response is in markdown? Either way, it needs to be easier to navigate her response.

Also, after Layer 3, there's a "Phase 4" section. That seems highly out of place give there are no other Phases.

The pricing shouldn't be a separate section, it should be included with the respective idea.

To make the user experience cleaner, can Andrea's response be organized by twistees (expand/collapse) headings for each Layer that allow the user to view only the one they want to see at any point?

Fair enough. Here's what I'm working with:

My read of the workflow:
Partner sends an email request → you extract the key terms → draft a contract from scratch or a template → review and send. Probably 5–15 contracts/week, mix of standard and custom terms.

Key Assumptions:
- Contracts follow recognizable patterns (service agreements, engagement letters, vendor terms)
- You're working in Word or Google Docs
- Some contracts are fairly standard; some require custom language
- No hard requirement for legal sign-off on every draft (or at least not before your first pass)
- You're at SM Advisors, not HCA — so lighter compliance burden than a

hospital system

Layer 1 — Step-Level Automation

Step	What AI Does	ROI	Type
Extract terms from partner email	Pulls key variables (parties, scope, dates, fees) from the email	**High**	NLP Extraction
Populate contract template	Inserts extracted variables into the right fields	**High**	Automated Data Entry
Flag missing or ambiguous terms	Alerts you before drafting if something's unclear	**Medium**	Anomaly Detection
First-pass redline review	Checks draft against your standard language	**Medium**	Document Classification

Layer 2 — Chunk Automation

"Email-to-Draft"
Combines: extraction + template population + gap flagging

A partner email comes in → AI reads it, pulls the deal terms, flags anything missing, and drops a populated draft into your workflow for review.

You stay in the loop for: anything non-standard, final language approval, and send.

ROI: High

Layer 3 — Full-Flow Automation

Feasible? Partially.

Routine, low-stakes contracts (standard terms, known partners) could run nearly end-to-end. But

contracts carry legal weight — full automation without human review creates real exposure, especially on scope, liability, and fee language.

Human role becomes: exception handler and final approver, not drafter.

Risk: AI confidently drafts bad language. You need a tight review gate before anything goes out.

ROI: Medium — the drafting time savings are real, but the review step doesn't disappear.

Phase 4 — What It Actually Looks Like (Layer 2)

Trigger: Partner email lands in your inbox.

Step 1: Zapier or Make detects the email, sends it to Claude API or a

the email, sends it to Claude API or a Claude Project.

Step 2: Claude reads the email and extracts: party names, engagement scope, fee structure, term dates, any special conditions.

Step 3: Claude populates your standard contract template with those variables. If a required field is missing (say, no end date specified), it flags it rather than guessing.

Step 4: A drafted contract drops into a Google Doc or Word file — named, formatted, ready for your review.

You spend 5 minutes reviewing instead of 30 drafting.

Pricing

You spend 5 minutes reviewing instead of 30 drafting.

Pricing

Layer	Tier	What That Means
Step-level (prompt-assisted drafting)	**$**	Claude Pro or ChatGPT Plus — you paste the email, get a draft
Email-to-Draft chunk	**$$–$$$**	Zapier/Make + Claude API; ~$50–$300/mo depending on volume
Full-flow with template management	**$$$$**	Custom build with doc generation, storage, and routing

---

Which layer feels like the right starting point — or should we dig into the email-to-draft chunk in more detail?
